

## Features

- High-performance, Low-power AVR® 8-bit Microcontroller
- Advanced RISC Architecture
  - 130 Powerful Instructions – Most Single-clock Cycle Execution
  - 32 x 8 General-purpose Working Registers
  - Fully Static Operation
  - Up to 8 MIPS Throughput at 8 MHz
  - On-chip 2-cycle Multiplier
- Nonvolatile Program and Data Memories
  - 32K Bytes of In-System Self-programmable Flash  
Endurance: 1,000 Write/Erase Cycles
  - Optional Boot Code Section with Independent Lock Bits  
In-System Programming by On-chip Boot Program
  - 1K Byte EEPROM  
Endurance: 100,000 Write/Erase Cycles
  - 2K Bytes Internal SRAM
  - Programming Lock for Software Security
- JTAG (IEEE Std. 1149.1 Compliant) Interface
  - Extensive On-chip Debug Support
  - Programming of Flash, EEPROM, Fuses, and Lock Bits through the JTAG Interface
  - Boundary-scan Capabilities According to the JTAG Standard
- Peripheral Features
  - Two 8-bit Timer/Counters with Separate Prescaler and Compare Mode
  - One 16-bit Timer/Counter with Separate Prescaler, Compare Mode, and Capture Mode
  - Real-time Counter with Separate Oscillator
  - Four PWM Channels
  - 8-channel, 10-bit ADC
  - Byte-oriented 2-wire Serial Interface
  - Programmable Serial USART
  - Master/Slave SPI Serial Interface
  - Programmable Watchdog Timer with Separate On-chip Oscillator
  - On-chip Analog Comparator
- Special Microcontroller Features
  - Power-on Reset and Programmable Brown-out Detection
  - Internal Calibrated RC Oscillator
  - External and Internal Interrupt Sources
  - Six Sleep Modes: Idle, ADC Noise Reduction, Power-save, Power-down, Standby and Extended Standby
- I/O and Packages
  - 32 Programmable I/O Lines
  - 40-pin PDIP and 44-lead TQFP
- Operating Voltages
  - 2.7 - 5.5V (ATmega323L)
  - 4.0 - 5.5V (ATmega323)
- Speed Grades
  - 0 - 4 MHz (ATmega323L)
  - 0 - 8 MHz (ATmega323)

## Overview

The ATmega323 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega323 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

## Block Diagram

The AVR core combines a rich instruction set with 32 general-purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega323 provides the following features: 32K bytes of In-System Programmable Flash, 1K bytes EEPROM, 2K bytes SRAM, 32 general purpose I/O lines, 32 general purpose working registers, a JTAG interface for Boundary-Scan, On-Chip Debugging support and programming, three flexible timer/counters with compare modes, internal and external interrupts, a serial programmable USART, a byte oriented 2-wire Serial Interface, an 8-channel, 10-bit ADC, a programmable Watchdog Timer with internal oscillator, an SPI serial port, and six software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, timer/counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the oscillator, disabling all other chip functions until the next interrupt or hardware reset. In Power-save mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction Mode stops the CPU and all I/O modules except asynchronous timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the crystal/resonator oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low-power consumption. In Extended Standby mode, both the main oscillator and the asynchronous timer continue to run.

The device is manufactured using Atmel's high-density nonvolatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed In-System through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the Application Flash memory. By combining an 8-bit RISC CPU with In-System Programmable Flash on a monolithic chip, the Atmel ATmega323 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega323 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

## Pin Descriptions

<b>VCC</b>	Digital supply voltage.
<b>GND</b>	Digital ground.
<b>Port A (PA7..PA0)</b>	Port A serves as the analog inputs to the A/D Converter. Port A also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port A output buffers can sink 20 mA and can drive LED displays directly. When pins PA0 to PA7 are used as inputs and are externally pulled low, they will source current if the internal pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.
<b>Port B (PB7..PB0)</b>	Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers can sink 20 mA. As inputs, Port B pins that are externally

pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B also serves the functions of various special features of the ATmega323 as listed on page 135.

## Port C (PC7..PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers can sink 20 mA. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port C also serves the functions of the JTAG interface and other special features of the ATmega323 as listed on page 142. If the JTAG interface is enabled, the pull-up resistors on pins PC5 (TDI), PC3 (TMS) and PC2 (TCK) will be activated even if a reset occurs.

## Port D (PD7..PD0)

Port D is an 8-bit bidirectional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers can sink 20 mA. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega323 as listed on page 147.

## RESET

Reset input. A low level on this pin for more than 500 ns will generate a reset, even if the clock is not running. Shorter pulses are not guaranteed to generate a reset.

## XTAL1

Input to the inverting oscillator amplifier and input to the internal clock operating circuit.

## XTAL2

Output from the inverting oscillator amplifier.

## AVCC

AVCC is the supply voltage pin for Port A and the A/D Converter. It should be externally connected to VCC, even if the ADC is not used. If the ADC is used, it should be connected to VCC through a low-pass filter. See page 124 for details on operation of the ADC.

## AREF

AREF is the analog reference pin for the A/D Converter. For ADC operations, a voltage in the range 2.56V to AVCC can be applied to this pin.

## AGND

Analog ground. If the board has a separate analog ground plane, this pin should be connected to this ground plane. Otherwise, connect to GND.

- Notes:
1. When the OCDEN fuse is unprogrammed, the OSCCAL register is always accessed on this address. Refer to the debugger specific documentation for details on how to use the OCDR register.
  2. Refer to the USART description for details on how to access UBRRH and UCSRC.
  3. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
  4. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers \$00 to \$1F only.

### Package Type

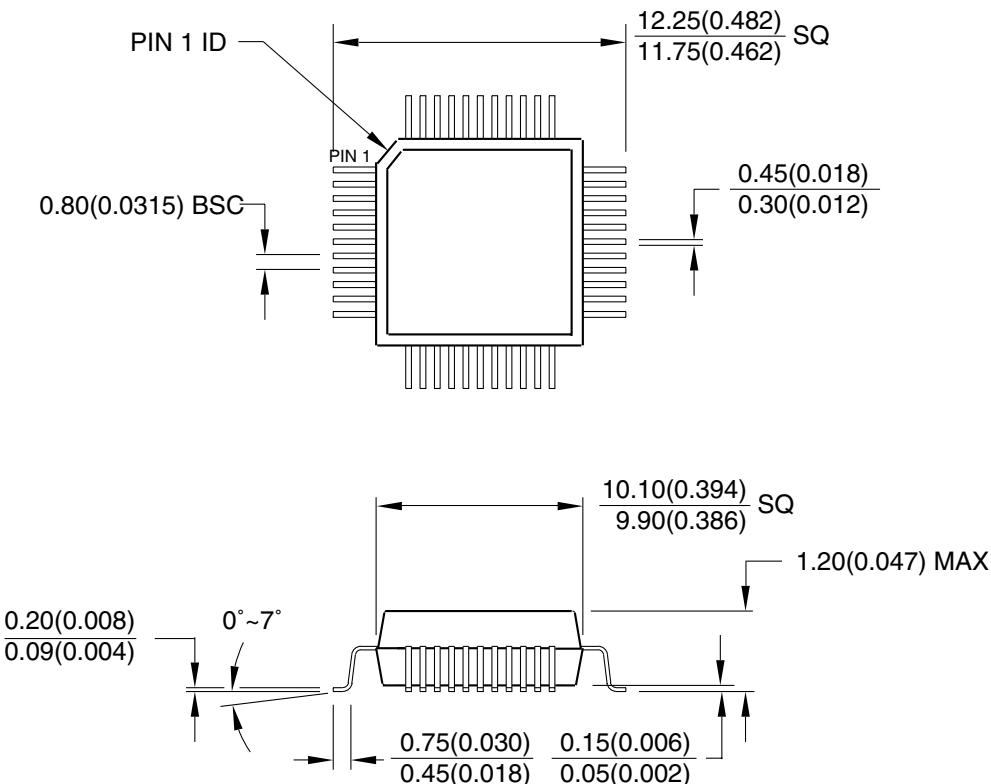

<b>44A</b>	44-lead, Thin (1.0 mm) Plastic Gull Wing Quad Flat Package (TQFP)
<b>40P6</b>	40-pin, 0.600" Wide, Plastic Dual Inline Package (PDIP)

## Packaging Information

44A

44-lead, Thin (1.0mm) Plastic Quad Flat Package  
(TQFP), 10x10mm body, 2.0mm footprint, 0.8mm pitch.  
Dimension in Millimeters and (Inches)\*  
JEDEC STANDARD MS-026 ACB

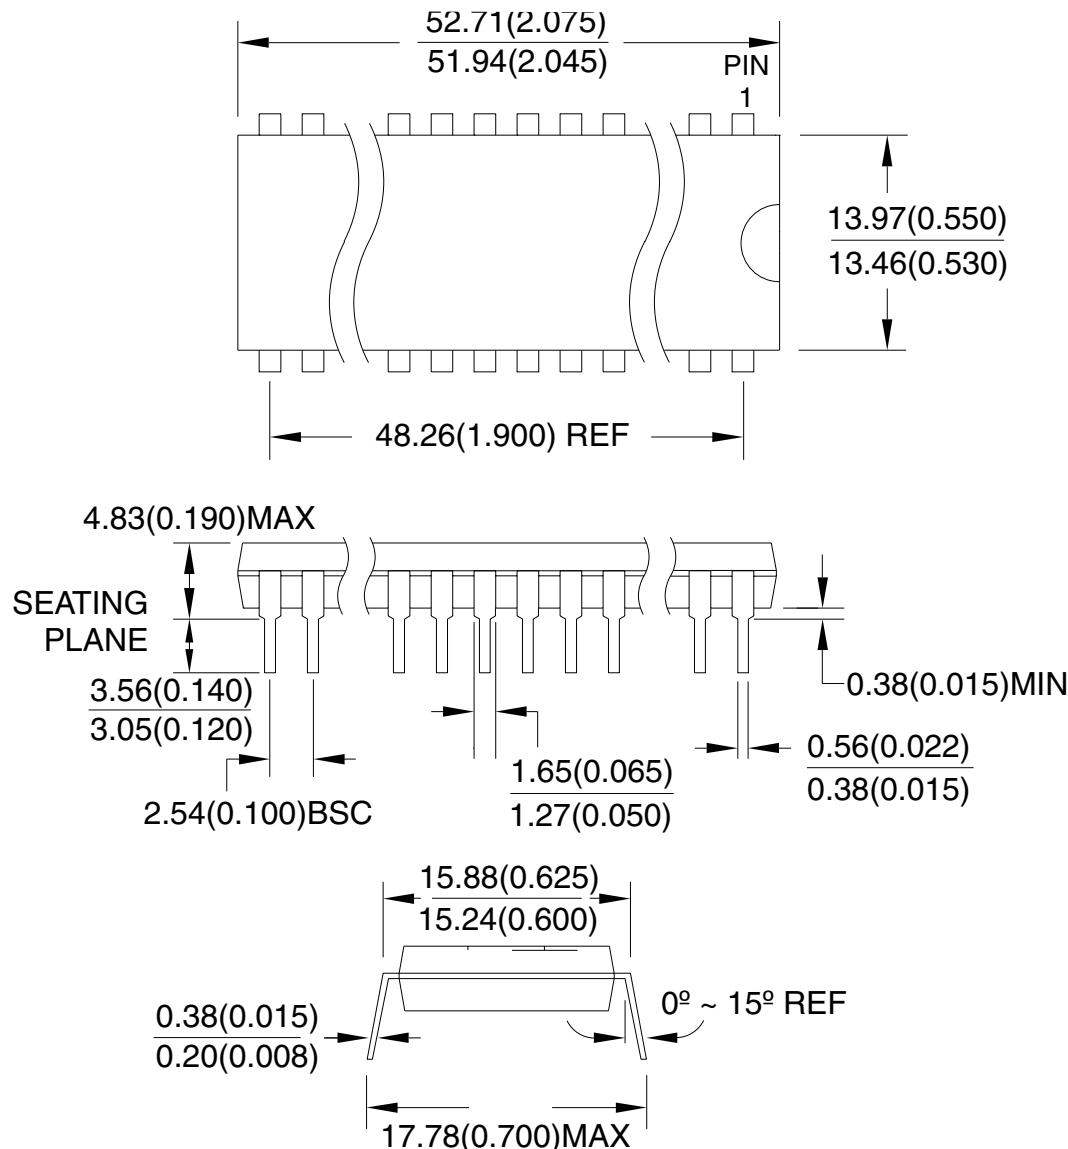

\*Controlling dimension: millimetre
