Project Overview: Prior Work - Networked Performance

Networking Models: **Open Sound Control**

Control messages sent over networks (local or wide) can be used to control musical systems

- Open-ended, dynamic, URL-style symbolic naming scheme
- Symbolic and high-resolution numeric argument data
- Pattern matching language to specify multiple recipients of a single message
- High resolution time tags
- "Bundles" of messages whose effects must occur simultaneously
- Query system to dynamically find out the capabilities of an OSC server and get documentation

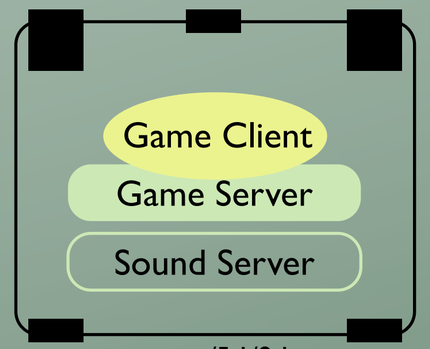
Performance Practice: Multiple Paradigms

Performance Practice: Multiple Paradigms

Single-user with a stereo/user-centric Sound-Server

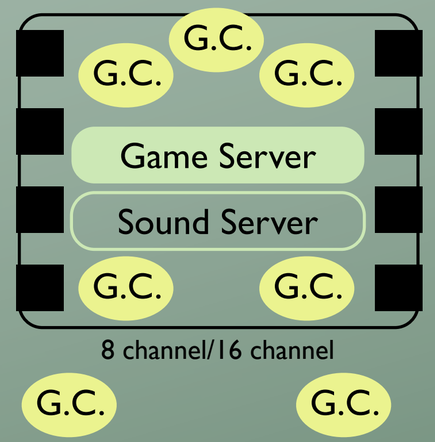
- standard gaming user-centric model
- remote users can sonify the environment and participate remotely with a concert-space presentation
- performance can be entirely virtual with all sonification carried out at client locations



Performance Practice: Multiple Paradigms

One Sound-Server with multiple speakers

- n-number of virtual local performers
- single concert-space for video and audio presentation
- can make use of more sophisticated methods of spatialization (Ambisonics)
- creating virtual audio environments through processing



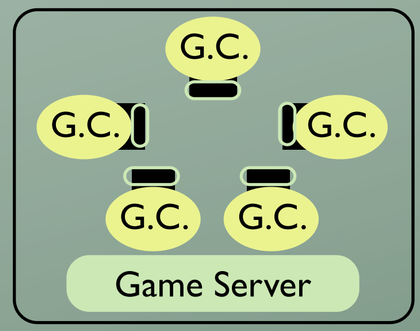
Single-user with a stereo/user-centric Sound-Server

- standard gaming user-centric model
- remote users can sonify the environment and participate remotely with a concert-space presentation
- performance can be entirely virtual with all sonification carried out at client locations

Performance Practice: Multiple Paradigms

n-number of Sound-Servers with point-source speakers

- n-number of virtual local performers connected to Sound-Servers
- single concert-space for video and audio presentation
- one-to-one correlation between virtual speaker locations and physical speaker locations



n-channels (point-source)

One Sound-Server with multiple speakers

- n-number of virtual local performers
- single concert-space for video and audio presentation
- can make use of more sophisticated methods of spatialization (Ambisonics)
- creating virtual audio environments through processing

Juan-Pablo Caceres,
Robert Hamilton,

Mixed Reality Performance è un esperimento in cui spazi fisici e musicisti di diversi continenti si incontrano nella realtà virtuale della rete. Promossa da MITO SettembreMusica in collaborazione con lo Stanford Humanities Lab e lo Stanford Center for Computer Research in Music and Acoustic, questa produzione è un esperimento d'interazione tra musicisti collocati in spazi definiti attraverso la realtà virtuale: un pianista suona e la sua musica viene manipolata da musicisti virtuali; dall'altra parte dell'oceano, altre realtà acustiche vengono manipolate e restituite all'interno di uno scenario virtuale tridimensionale proiettato sulle pareti. Lo spettatore è immerso in un mondo sonoro ricreato, in un'istallazione che segna la nascita di spazi performativi in Sirikata, la più recente piattaforma informatica open source.

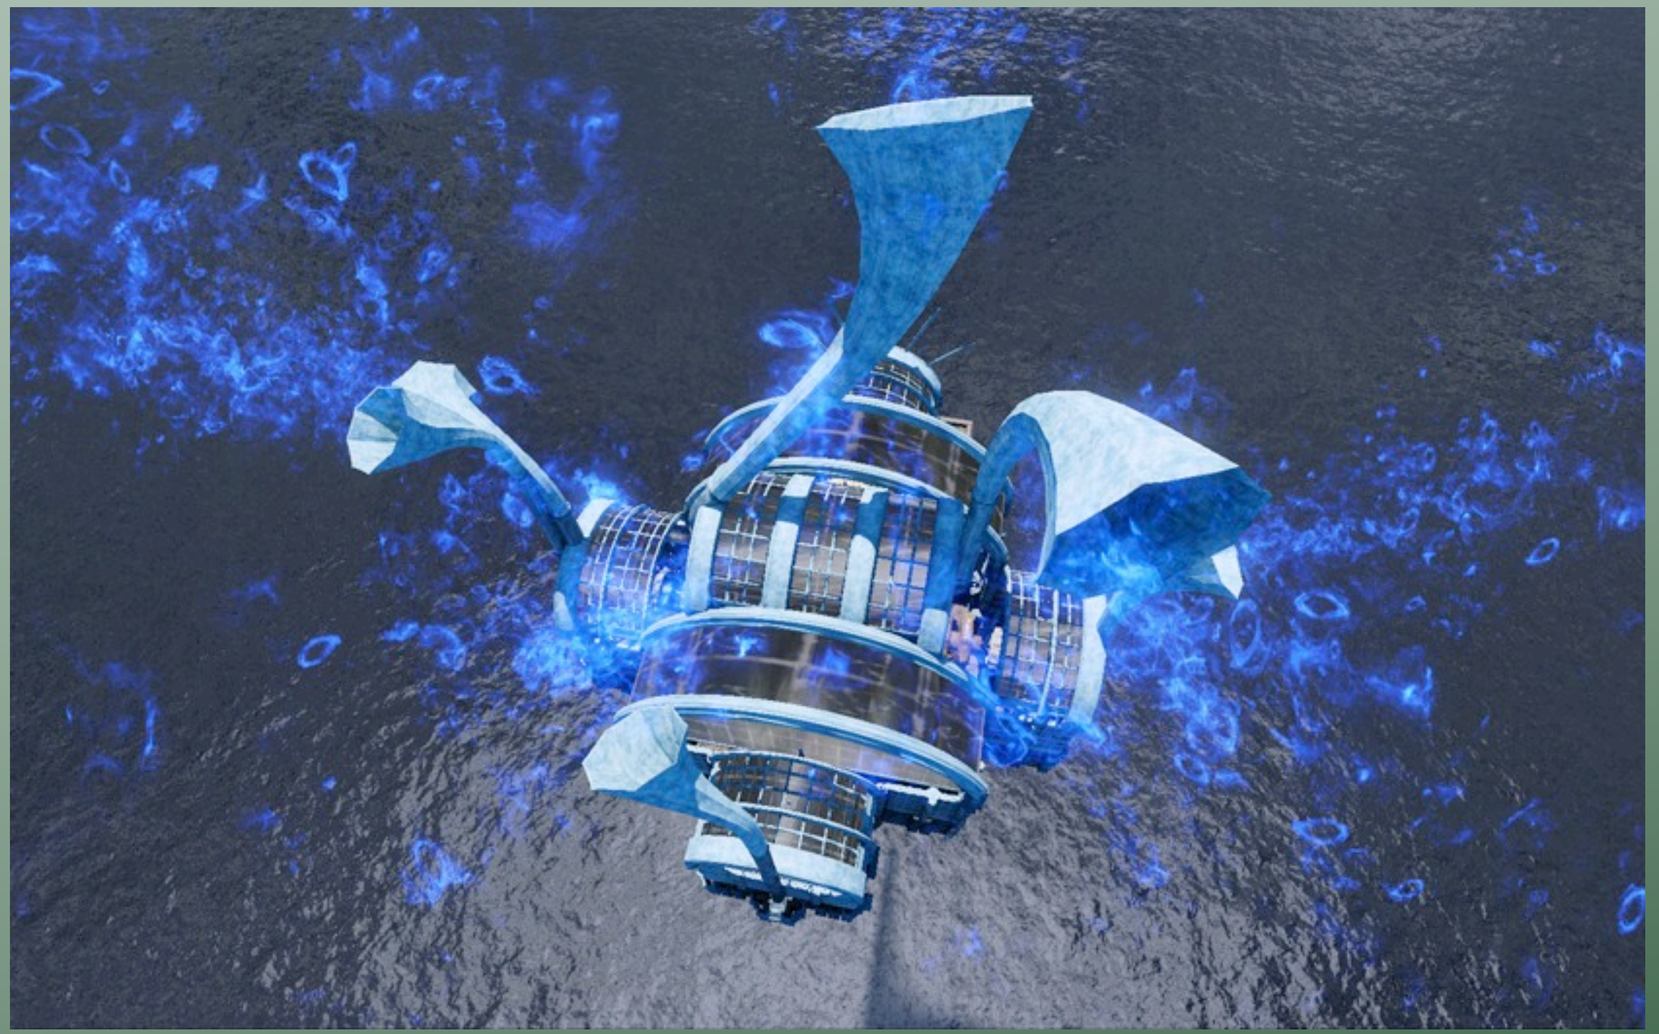
Tele-harmonium



rob@ccrma.stanford.edu

Tele-harmonium

Piano: Chryssie Nanou
UDKOSC: Robert Hamilton

Music by Robert Hamilton
Art Direction by Chris Platz

Tele-Harmonium is the first piece realized using UDKOSC, a modded UDK (Unreal Development Kit) project which incorporates an Open Sound Control implementation (OSCPack by Ross Bencina) to allow in-game motions and actions to drive synthesis and spatialization in a SuperCollider sound server. In this way, messages like client and projectile positioning, actor motions, etc. from the game engine are sent formatted as OSC messages over UDP to OSC-capable multi-channel sound engines written in a variety of computer-music languages (SuperCollider, ChucK, Max/MSP, PD) and used to control complex sound and music generation code. Similarly, messages from the sound engines (i.e. measuring microphone amplitude or a musical note's frequency) or external controller data (i.e. iPad or Wiimote) can be sent back into UnrealScript via a thread running in the DLL, and used to control a variety of UDK params (system gravity, game speed, projectile homing target location).

The piece makes use of Scarlatti's Sonata For Keyboard in D Minor, K.213 (L.108) "The Lover" as a central theme, both through direct quotation and through modification.
