What is it for?
Over 6 million Americans have a developmental disability, but resources for these individuals are sparse, scattered, and out of sight. Especially with families with socioeconomic or language barriers, these struggles can have an imprint on one’s entire life. NeuroCenter aims to congregate as many governmental resources, nonprofit institutions, and company services for individuals with developmental disabilities to utilize.

What is the medium?
The medium is a friendly mobile application that allows for a couple key features outlined in the design layout below.

Who does it affect and how?
This app could affect up to the 6 million people in the US who have developmental disabilities and their families, friends, and community members who look out for them. Altogether, this product has a tremendous scope across the United States. NeuroCenter has this impact because of its service matching platform, accountability, and progress tracking features that allow for group effectiveness.

Product User Manual
1. **AI-evaluated entry survey.**
   The AI-evaluated entry survey is used to collect essential information from a user to provide the best possible experience to the user. This survey revolves around demographic information and situational feedback. From a variety of family and user interviews and surveys, the NeuroCenter team has collected the seven most challenging problems people with developmental disabilities face. These problems are presented and users check off the ones that most challenge them. Based on this data, the NeuroCenter app makes a feed of opportunities and services that the user can use.

2. **Accountability messaging and sharing.**
   After the initial survey is done, a user can invite their family, friends or community members to view and message them about their progress on their goals.

3. **Performance Reports**
   Every month, NeuroCenter also publishes a performance report that is accessible to the user and automatically gets sent out to supporting members of the user to boost productivity.
