

# ISSE – An Interactive Source Separation Editor, Part I

Nicholas J. Bryan  
Stanford University

Sound Check

# Overview

- Introduction
- Demonstration
- Software
- Perspective
- Algorithm
- Download!

# Single-Channel Source Separation

- Generally, a very difficult problem
- Large underdetermined system of equations
- Many strategies to overcome this problem
- We will employ interactive feedback

# Denoising

- Live broadcast/TV
- Live recordings (e.g. orchestra cough)
- Studio recordings

# Spatial Audio and Upmixing

- Consumer electronics
- Home stereo systems

# Audio Post-Production and Remastering

- Extracting dialogue from old movies
- Redo music and sound fx
- Removing noisy hum, hiss, etc. in old tape recordings

# Music Information Retrieval

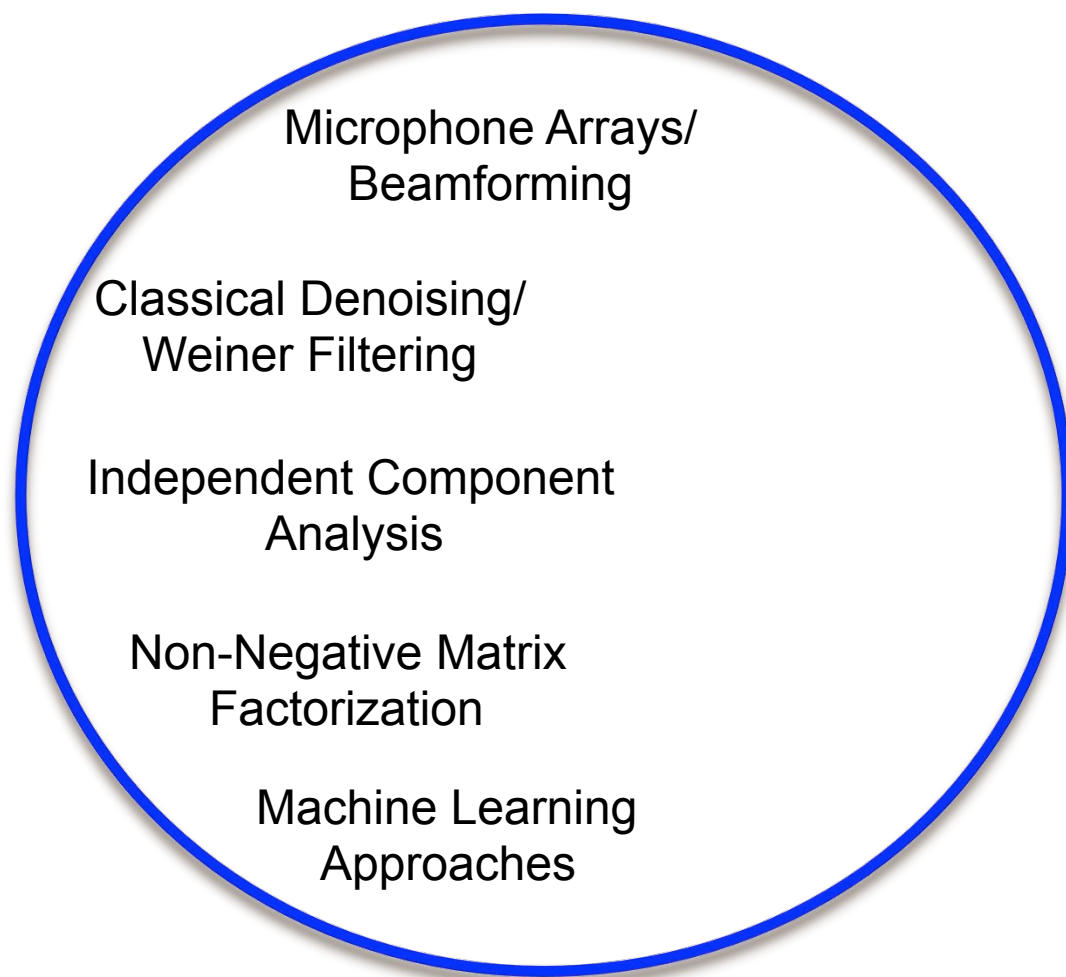

- Automatic speech recognition
- Tempo estimation
- Key detection
- Melody extraction

# Music Remixing and Content Creation

- DJs
- Sound artists
- Electronic musicians
- Audio/recording engineers

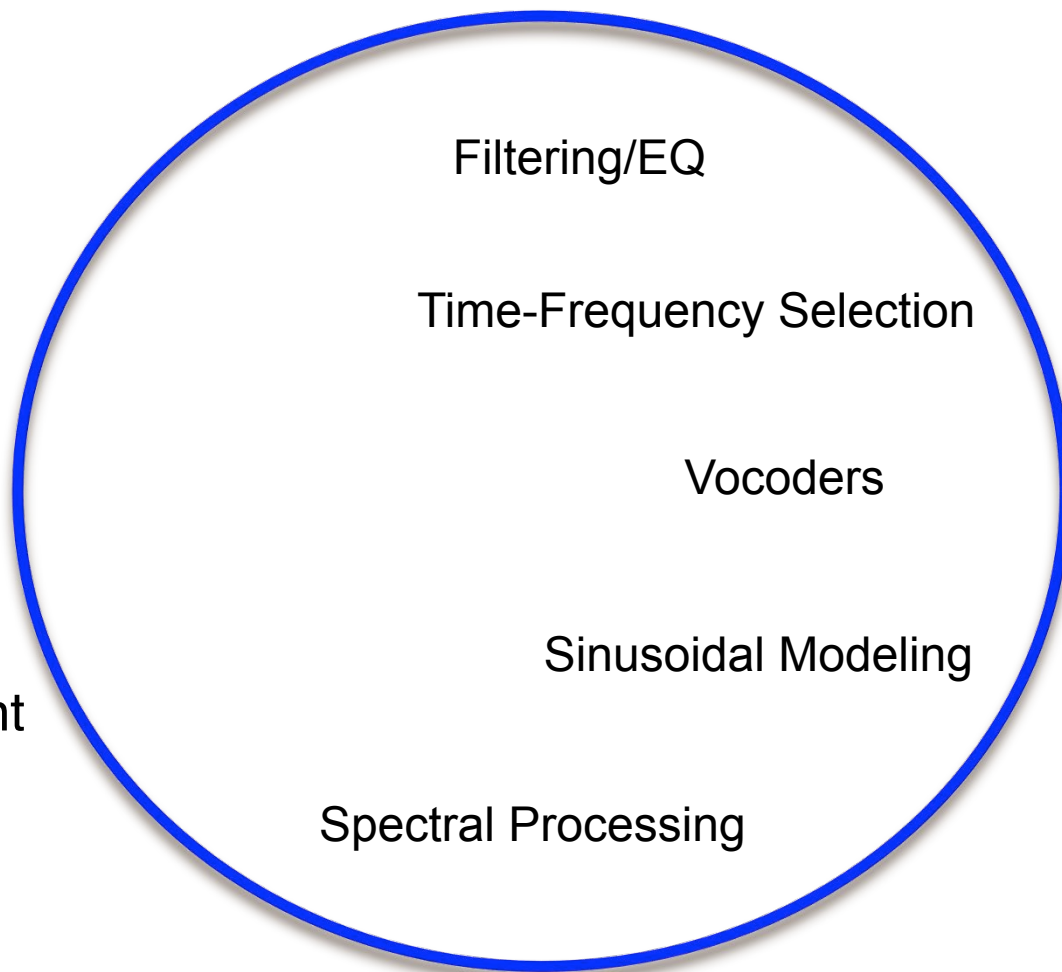

# Automatic

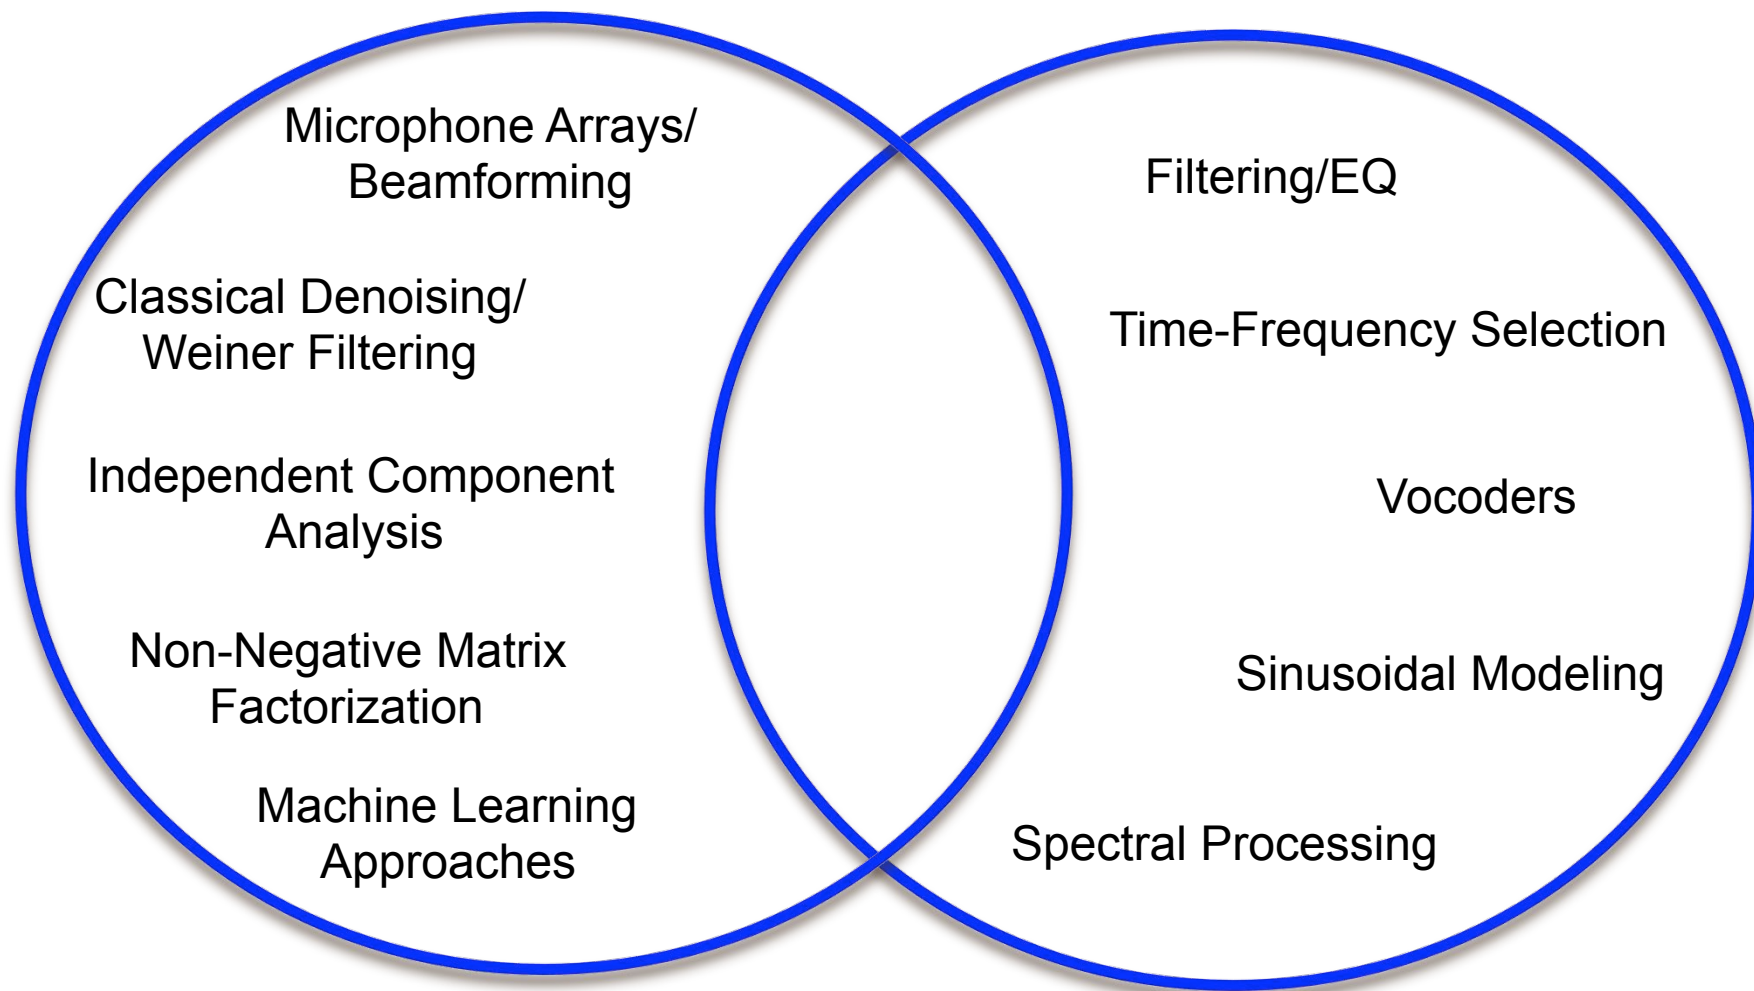

- Powerful
- Operate independently
- Operate based on the geometry or statistics
- Can breakdown/fail
- No way to correct for errors

# Manual

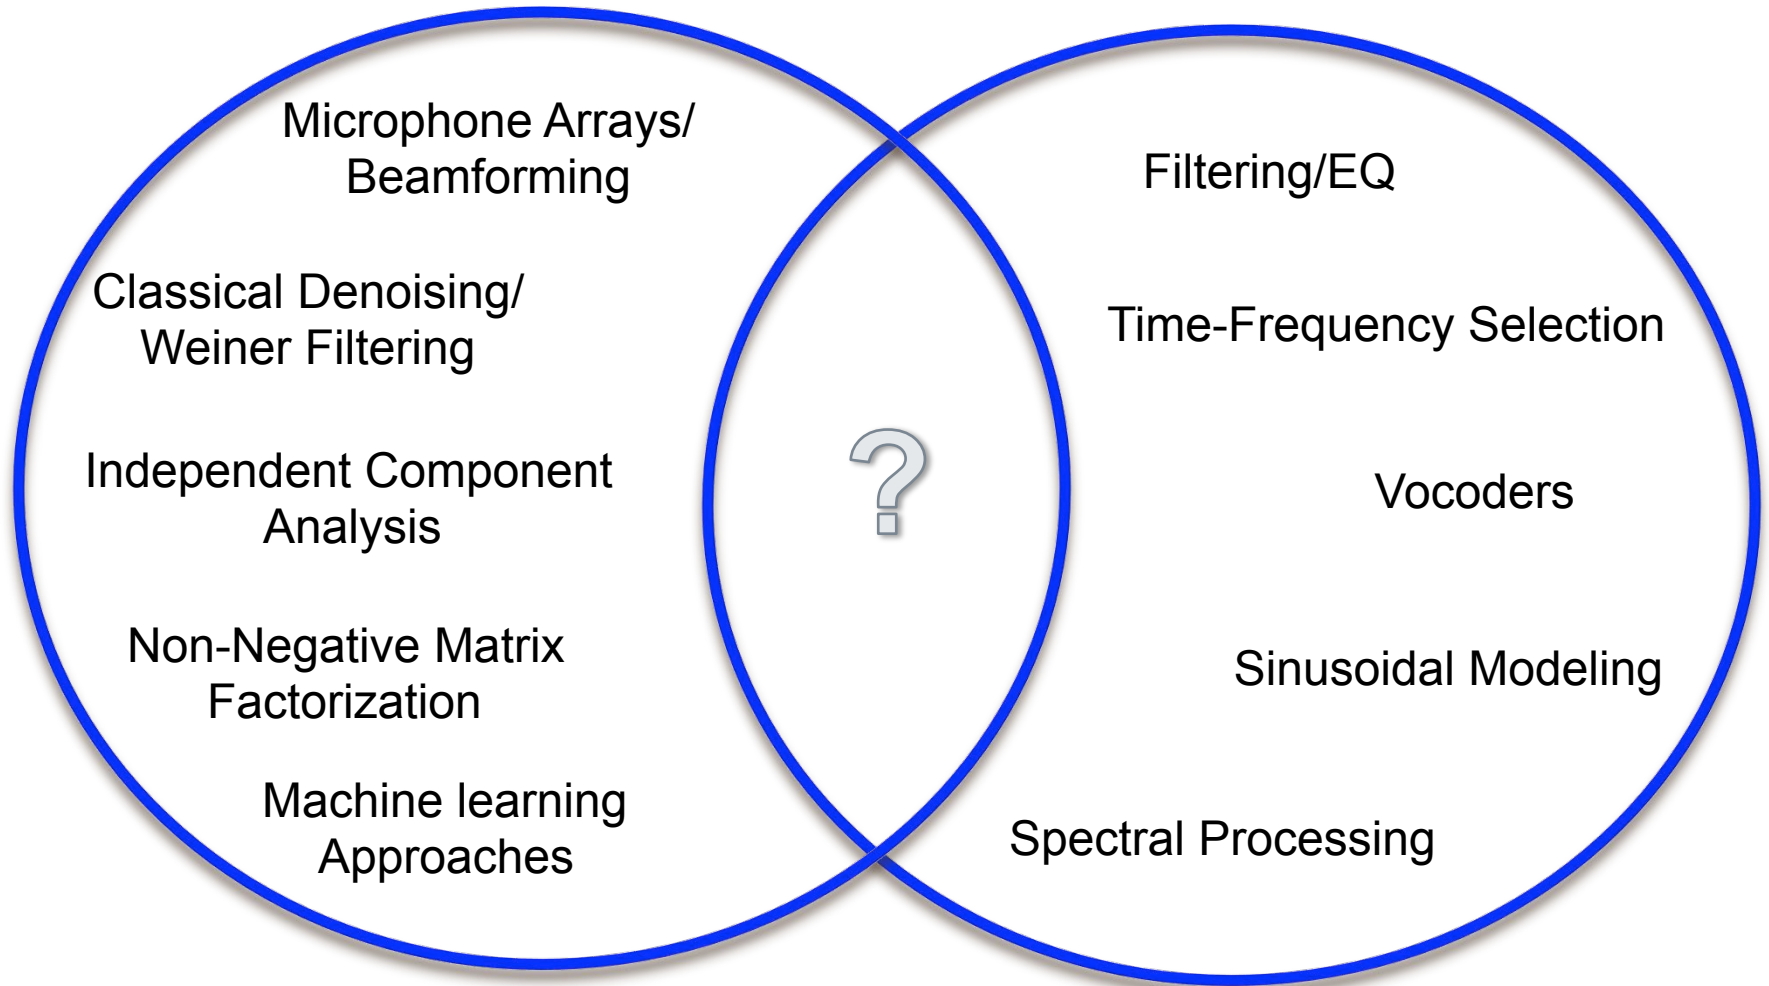

- Tedious, manual work
- Work on simple cases
- Cannot achieve quality of automatic approaches
- Allow adjustment refinement

# Automatic vs. Manual

# Automatic and Manual

# User's Perspective

- DJs
- Sound artists
- Electronic musicians
- Audio/recording engineers

# User's Perspective

- How does an audio/recording engineer perform source separation?

Audio editing, plugin, processing

- For what purpose?

Music remixing and content creation

- What skill level?

Advanced knowledge and skill

# Analogy

- Photoshop “layers”

...

- 3D Sculpting

...

...

- User-feedback is key!

# Automatic and Manual

- Balance between machine and the human user

# Automatic and Manual

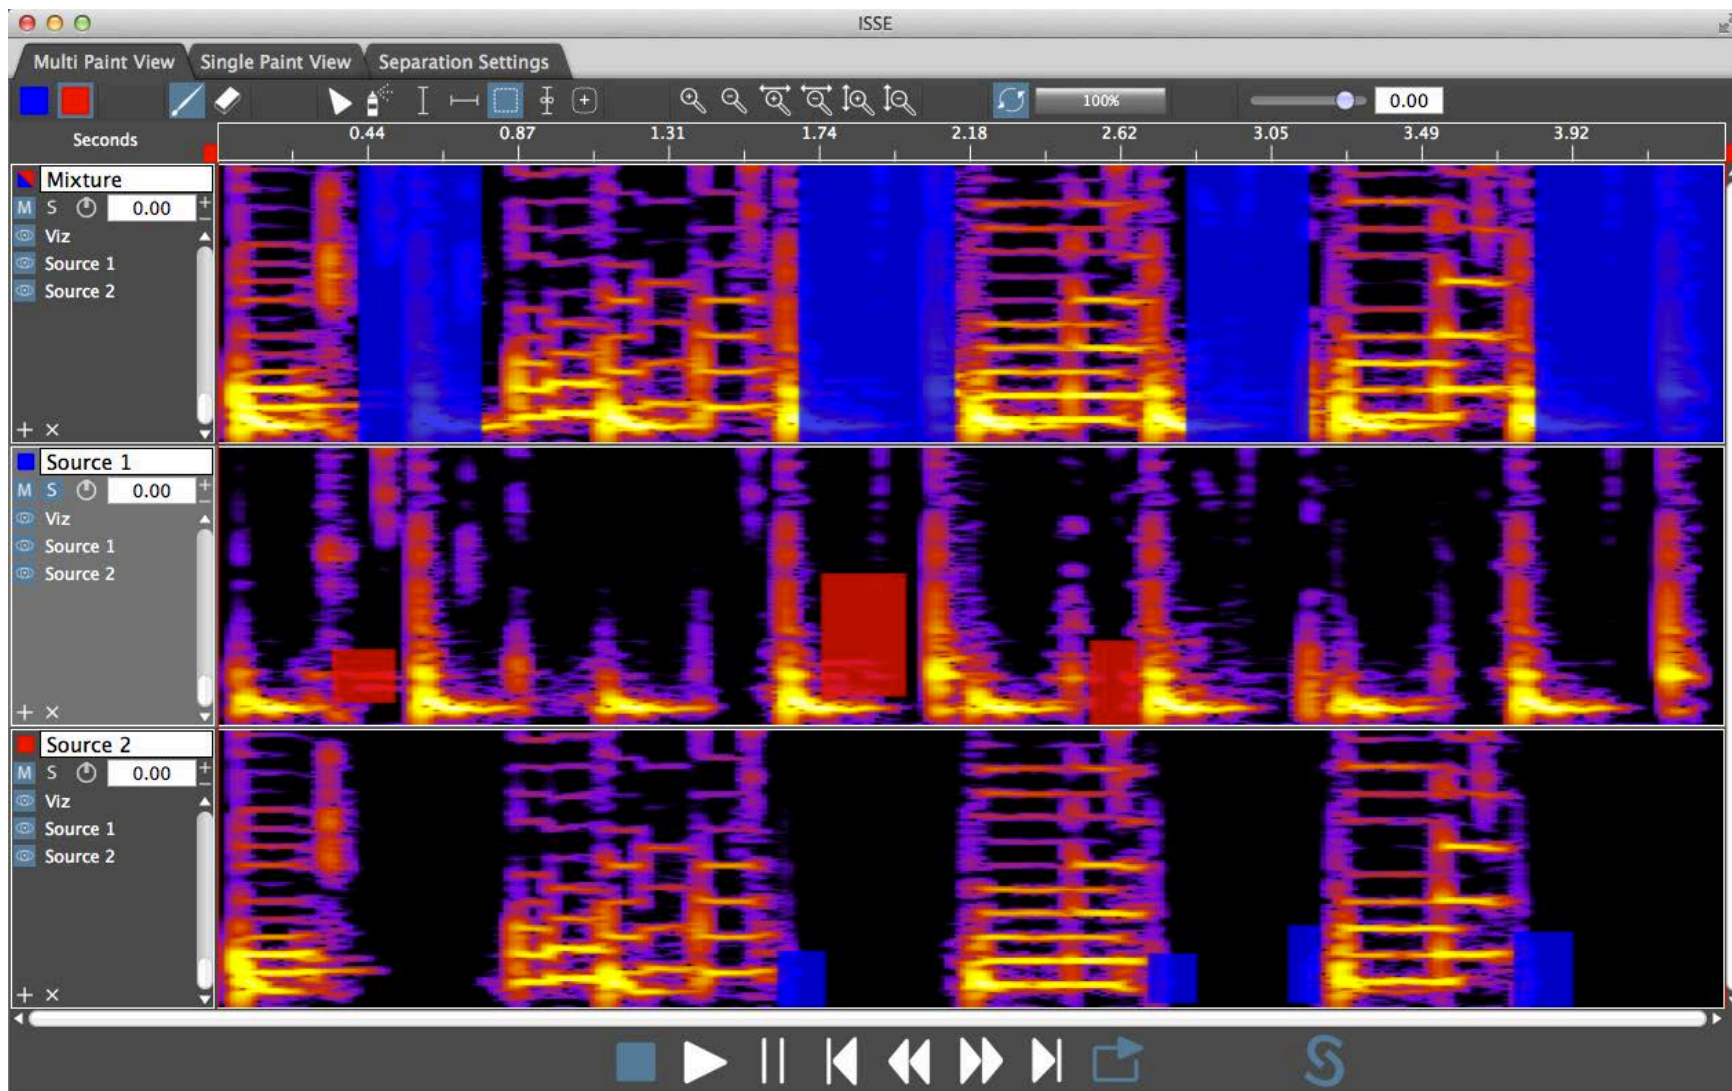

- Very exciting products over the past decade
- Melodyne/Celemony
- iZotope RX
- Adobe Audition
- Many others (please shout out!)

# ISSE Overview

- Alpha release, open-source, freely available project.
- Cross-platform (OSX, Windows, Linux), C++.
- Useful for applications such as:
  - Music remixing/upmixing**
  - Audio-based forensics**
  - Audio denoising**
  - Dialogue extraction**

- Released in collaboration with:

- Adobe Research
- Stanford University

# Third-Party Dependencies

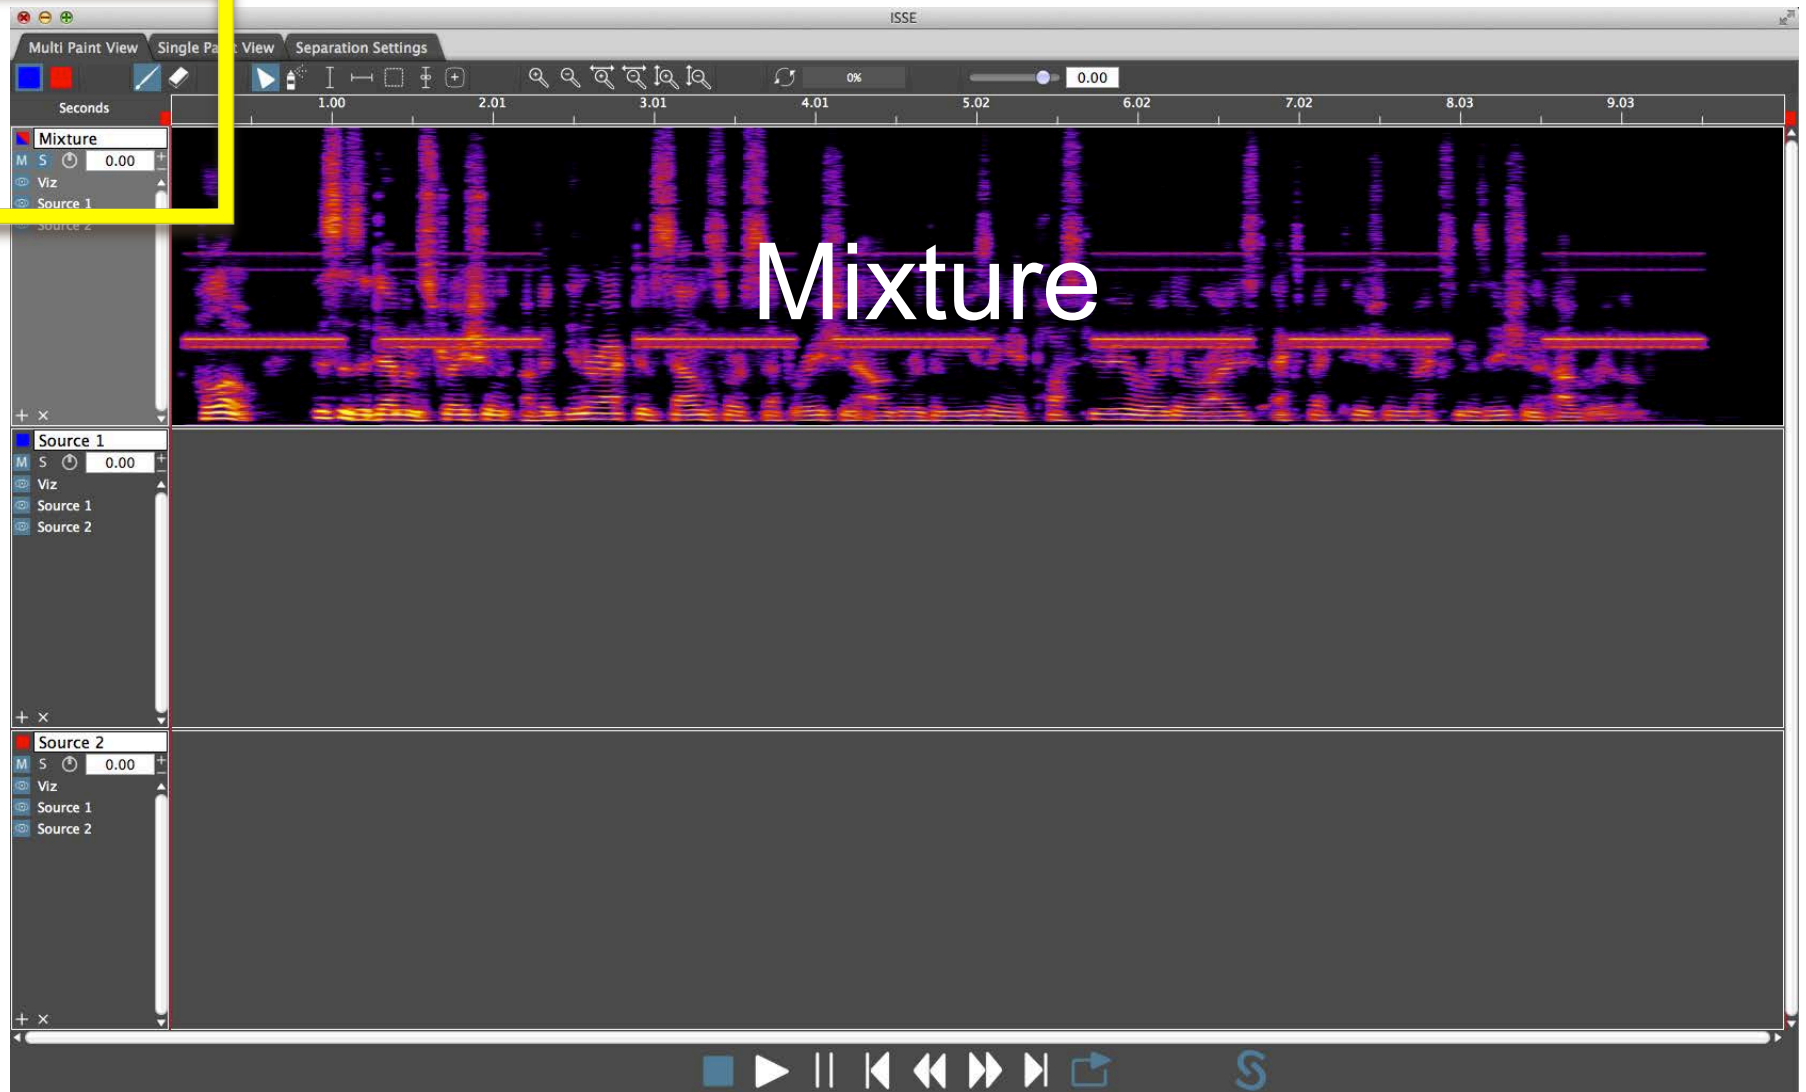

- JUCE ([juce.com](http://juce.com))
  - An extensive, cross-platform C++ toolkit
  - GUI windowing, widgets, audio playback
  - Open-source with GPL license
- Eigen ([eigen.tuxfamily.org](http://eigen.tuxfamily.org))
  - C++ template library for linear algebra and matrix library
  - Mozilla Public License 2
- FFTW ([fftw.org](http://fftw.org))
  - Cross-platform C library for fast Fourier transforms
  - GPL license

Load in a short 5-30 second recording (a chorus, verse, etc.)

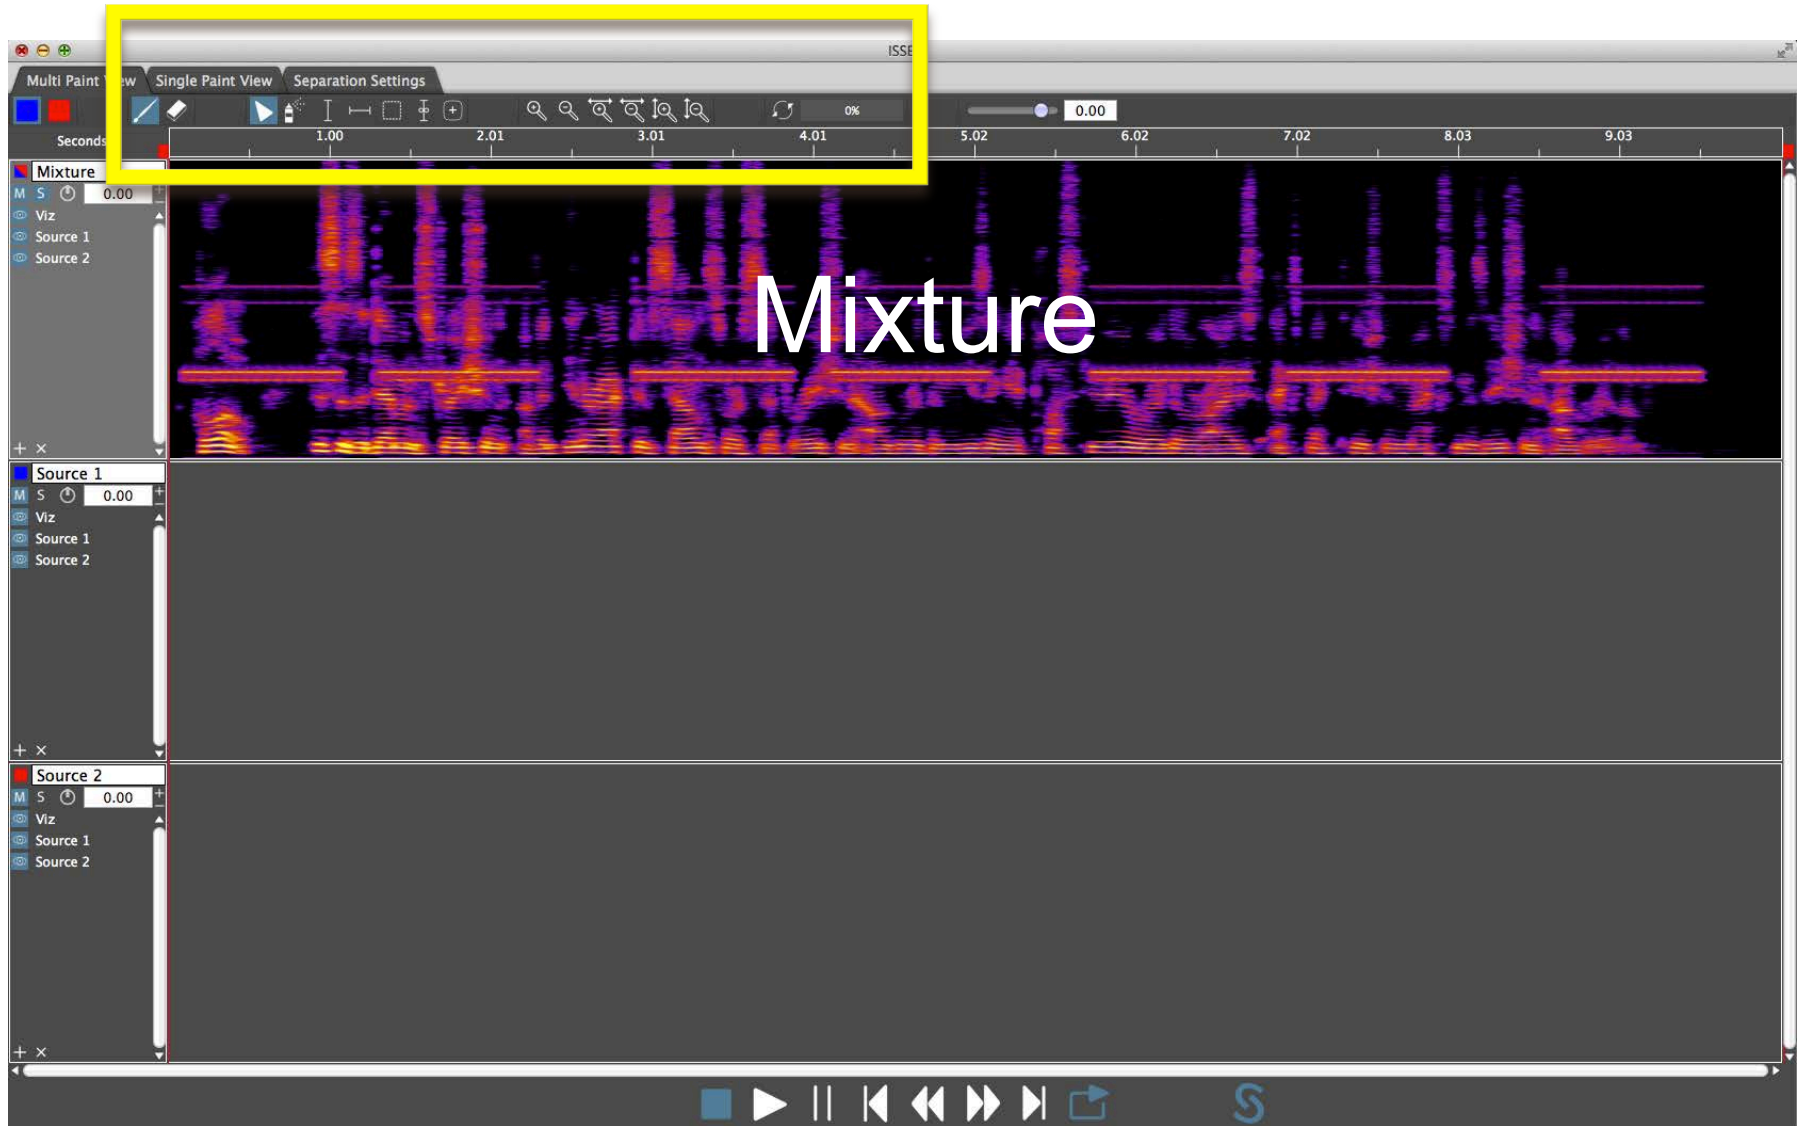

# Choose What to Separate

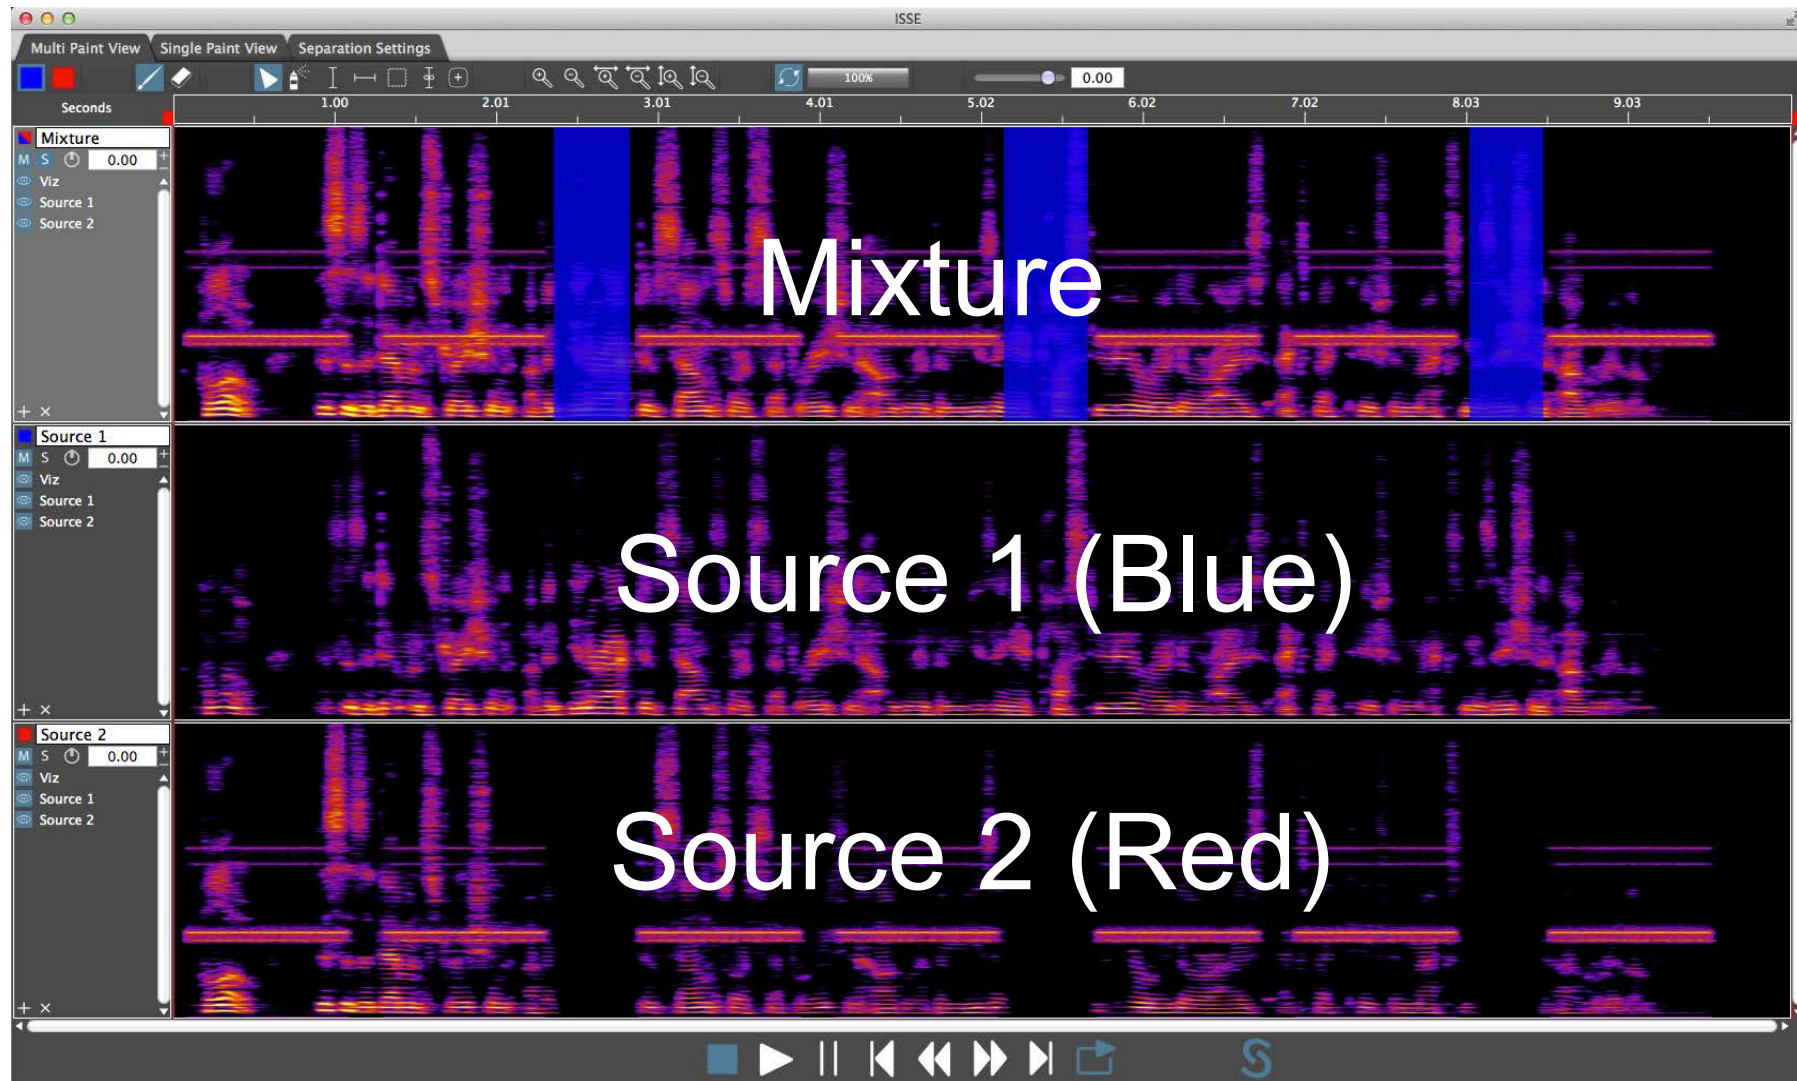

# Start Painting, Processing, & Listening

Automatically updates processing after annotations when processing is on

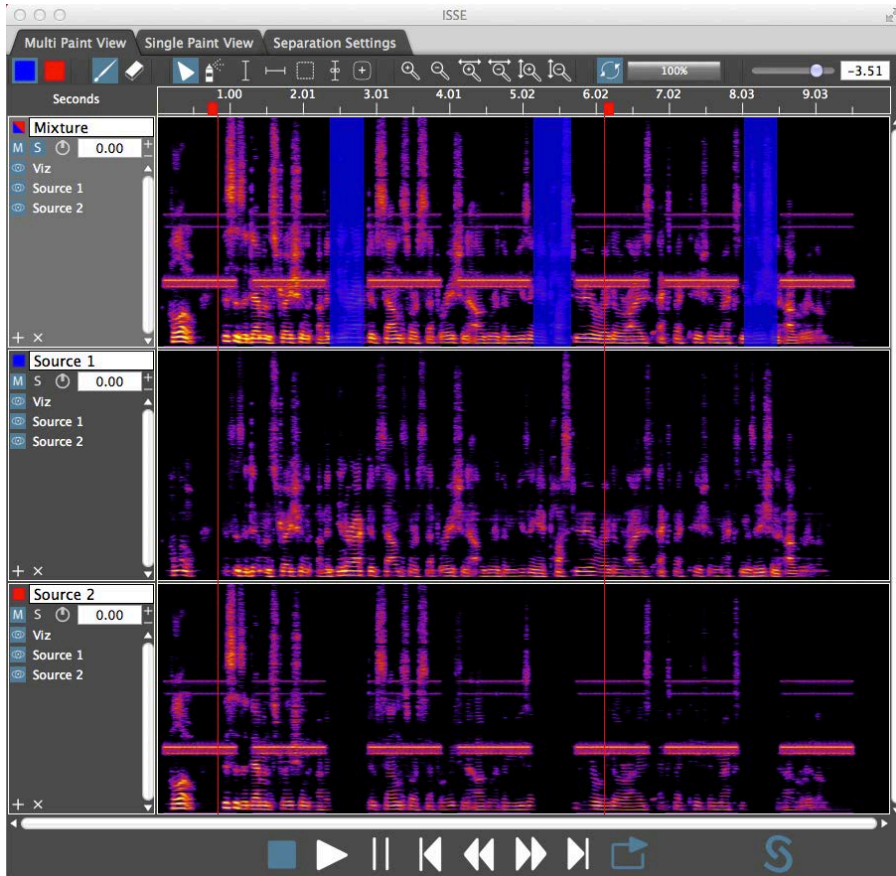

# Start Painting, Processing, & Listening

# Display Controls I

## Multi Paint View

## Single Paint View

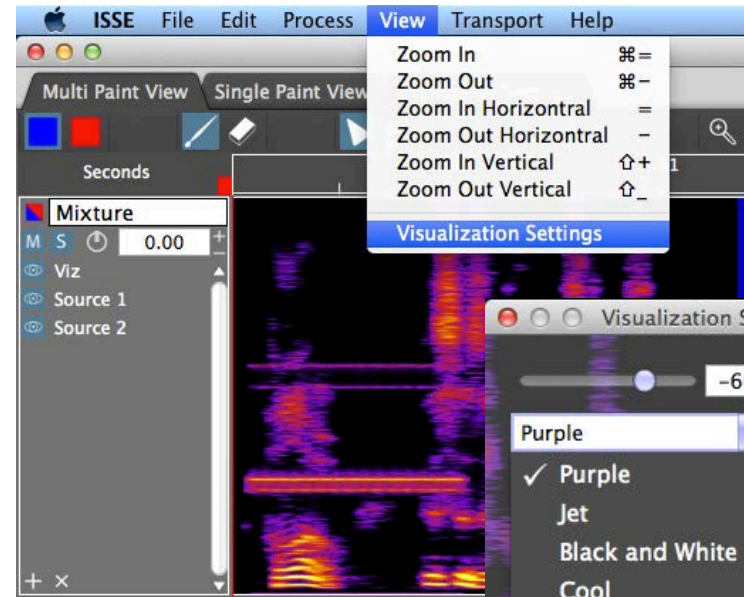

# Display Controls II

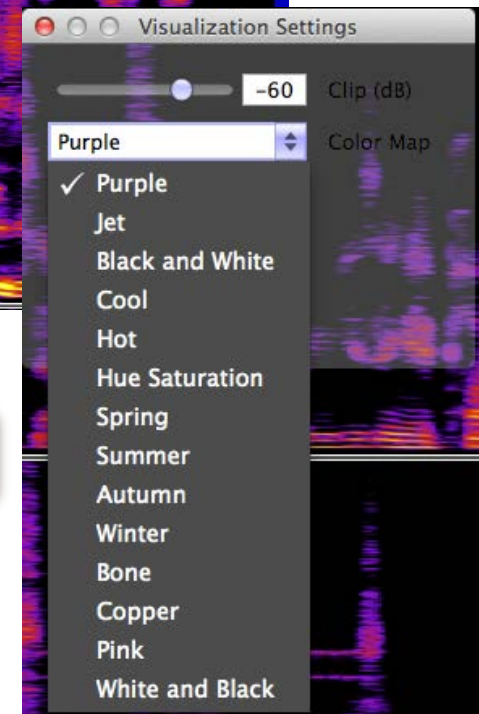

Zoom controls

Layer visibility

Visualization Controls

# Transport Control

Master volume

Play, pause, stop, loop, etc.

Auto Solo

Mute, solo, volume

Loop markers, playback cursor placement

# Painting Controls

Source select

Brush select: time, frequency,  
box, training, spray

Additional brush controls

Paint or erase

Color control

0.75 Opacity

50.0 Width

5.0 Height

☒ Accumulate Paint

Mixture

M S 0.00 +

Viz

Source 1

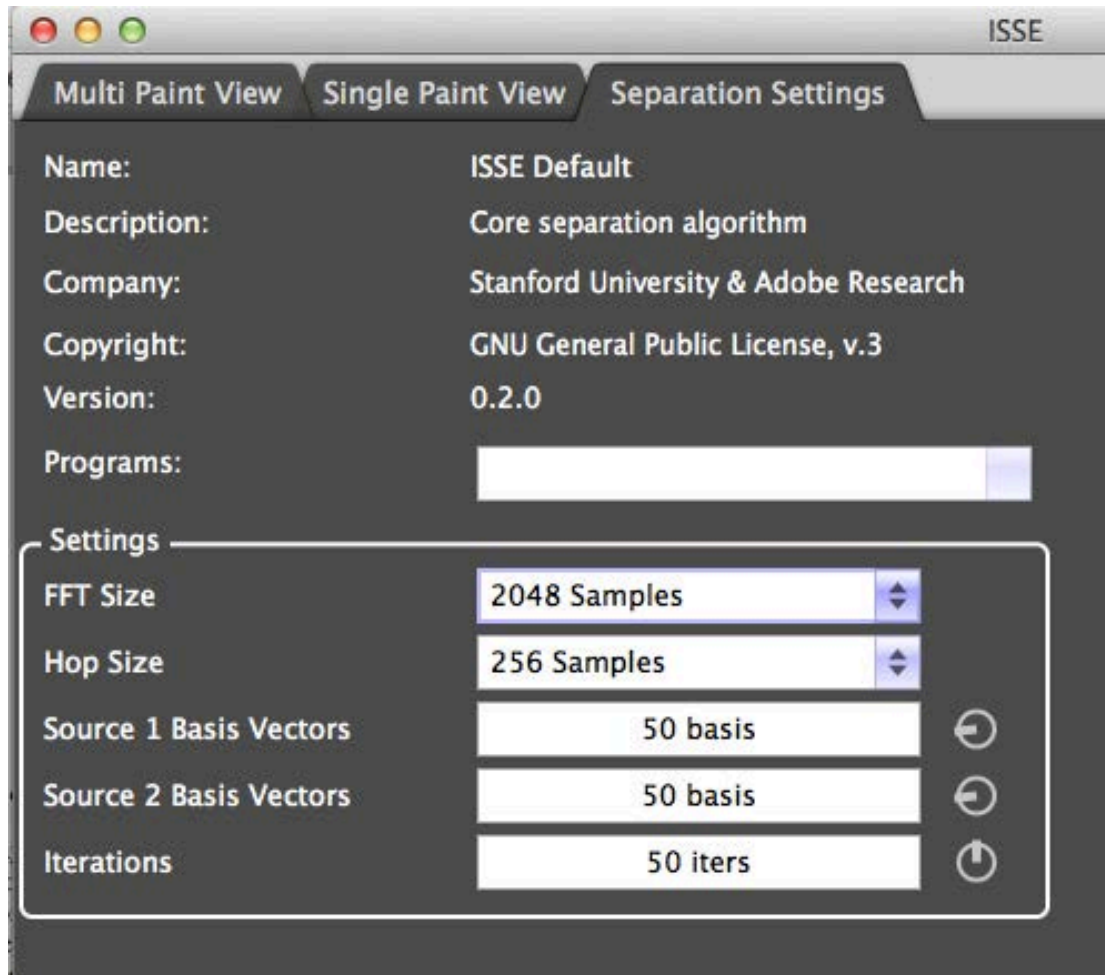

Source 2

Add and clear paintings

+ ×

# Processing Control

On/Off, progress

FFT and HOP size  
Changing clears paintings

Iterations, number  
of basis vectors

Parameters all effect processing speed

# Save, Loading, Undo, Redo

- Project saving and loading
- Undo/redo
  - Cleared on save
  - Currently implementation is memory intensive

# Overview

- Introduction
- Demonstration
- Software
- **Perspective**
- Algorithm
- Download!

# Perspective I

- Machine learning approach that constantly **adapts** to user annotations
- User is **training** the separation algorithm
- Separation algorithm is **learning** what to separate
- A single, **local** annotation can have a **global** effect on separation quality

## Perspective II

- **Reduces** manual **effort** required by the user
- **Not copying** the pixel data underneath the annotations
- Improves upon automatic approaches via user-**refinement**
- Indirectly incorporate a **perceptual objective** into the separation algorithm

# Strategy

- High-quality separation will take **time** (separate 100+, 1000+ times)
- Work with **short** sound files
- Paint on regions **large-to-small**
- **Annotate, listen, and refine**
- Each **iteration** is (hopefully) an improvement. If not, undo and continue.

# Strategy: Large-to-Small Annotations

1. Time regions (time brush, training brush, box brush)
2. Frequency regions (frequency brush, box brush)
3. Large time-frequency regions (box brush, spray brush)
4. Harmonics, fricatives, transients, and detail (box brush, spray brush)

# Limitations

- Significant learning curve
  - Difficult at first
  - You will improve
- Will not work well on all sounds
  - Very dense or noisy sounds
  - Highly orchestrated music
- Bugs
  - Slow and/or crashes with long files (try 5-30 seconds)
  - A few issues with older OS...

# But!

- We're constantly working on upgrades
- Interested in gaining community developers
- Will have a third-party plugin format

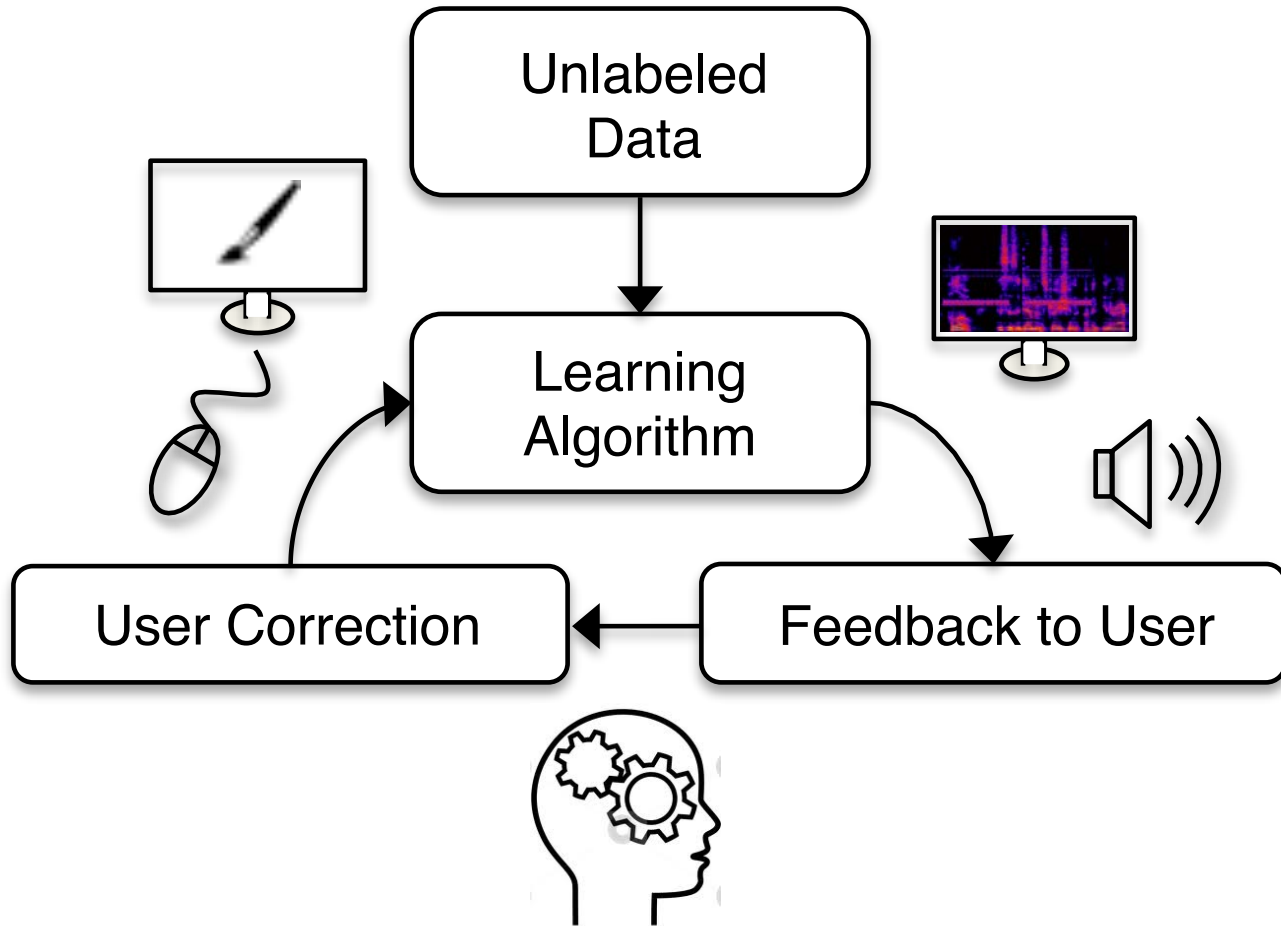

# Overview

- Introduction
- Demonstration
- Software
- Perspective
- **Algorithm**
- Download!

## How does it work?

- A model-based approach (NMF)
- Build a model of each sound source that together explain the mixture
- Learn the parameters of the model from data
- Leverage the user to help with the parameter estimation
- Interactive machine learning

# Block Diagram

# Non-negative matrix factorization

- Non-negative matrix factorization & probabilistic models
  - [Lee & Seung, 2001]
  - [Smaragdis & Brown 2003]
  - [Raj & Smaragdis 2005, Smaragdis et al., 2006]
  - [Virtanen et al. 2007]
  - [Févotte et al. 2009]
  - Mysore, Fitzgerald, and many others

# NMF With Spectrogram Data

Spectrogram

Frequency  
Model

Gains/Weights

- Frequency model
- Weights or gains of frequency
